

## Adding a keyline in Lightroom

Lightroom does not have a way to add a keyline, except for the option in the Print Module. However if you really want to do it from Lightroom there is a third party plug-in called **LR/Mogrify** (!) which inserts a stage into the **Export** dialogue.

Download **LR/Mogrify** from <https://www.photographers-toolbox.com/products/lrmogrify2.php>. PC users will also need to download and install **ImageMagick 7** which you can get via this site. Mac users do not.

PC users install **ImageMagick**

Extract the folder **LRMogrify2.Irplugin** from the zip folder and move it to a convenient location (I suggest the same folder as the Lightroom catalogue files) and remember where it is!

Open Lightroom and select **Edit|Plug-in Manager**. Add and navigate to the location where you saved the **LRMogrify2.plugin** folder. Select it to install the plug-in.

## Using LRMogrify

“**Export**” the image

You will see (1), under **Post-Process Actions**, **LR/Mogrify2**.

(2) Select **Inner Borders** and (3) **Insert** to add LRMogrify to the Export dialogue.

As you work down the Export steps, ignore **Mogrify Configuration**.

(4) Reach **Mogrify Inner Border Options**. With **Identical Borders** ticked (5), set **Inset** to **0** and **Size** to **2 pixels** (6). Select the colour you want (7).

**Export** as normal and check the export file to show the keyline has been added.
